

# Multinational Bank Improves IT Disaster Recovery with Cutover

## 1. Challenge

- Annual resilience tests involve thousands of people globally and 2000+ apps
- Decentralized and non-standardized testing procedures and recovery plans
- Event planning and preparation took weeks
- The reporting capabilities of the existing home-grown system were inadequate for regulators
- Reporting and audit trails were insufficient to de-risk against regulatory concerns

## 2. Solution

- Now able to host Technical Recovery Plans (TRPs) and configure them into test scenarios in minutes
- Standardized TRPs using templates, reducing the work needed to finalize Data Center Recovery test runbooks
- Real-time status information and updates

## 3. How did Cutover make a difference?

- Event planning was reduced from weeks to days
- An easily managed and centralized repository of thousands of recovery plans
- Standardized and observable event execution led to fewer issues and better decision making
- Robust auditability and reporting means resulted in meeting all audit requirements

Results:

**70%**

Reduction in event planning time
